1. Introduction

This report was prepared by Oliver, Wyman Limited (Oliver Wyman), actuarial consultants to the Alberta Automobile Insurance Rate Board (the Board), as part of the Board's "2019 Annual Review" of Industry experience to determine Benchmarks for commercial vehicle rate filings submitted between October 1, 2019 and March 31, 2020.

This report presents the results of our analysis of Alberta's Industry commercial vehicles loss and expense experience reported as of December 31, 2018.

The scope of our analysis includes all coverages:

- Basic Coverage: Third Party Liability (TPL) and Accident Benefits (AB)
- Additional Coverage: Collision, Comprehensive, All Perils, Specified Perils, and Underinsured Motorist

1.1. Data and Reliances

The data utilized in this study and presented in this report is based on information published by the General Insurance Statistical Agency (GISA) that has been compiled by GISA's service provider, the Insurance Bureau of Canada (IBC). Consistent with the reports published by GISA (and to increase the volume of data), fleet vehicles are included. We have not audited, verified, or reviewed this data for reasonableness, accuracy, or consistency, as it is outside the scope of our study. In the event material errors are found in this data, our findings may need to be revised.

1.2. Limitations

The assumptions and judgments we have made in selecting the factors, provisions, and methodologies that we present in this report are for the Board's consideration. The benchmarks are based on data and information made available to us at the time of this analysis and apply to rate filings submitted between October 1, 2019 and March 31, 2020. Our assumptions, judgments, and findings are subject to uncertainty as is inherent in any actuarial estimate. In addition, due to (i) the Minor Injury Regulation, (ii) challenges (including court decisions and interpretations) thereto since first introduced, and (iii) the changes in the economic environment, we believe that our assumptions, judgments, and findings continue to be subject to a greater than normal degree of uncertainty.

Our analysis reflects the experience of the insurance industry as a whole, including the Facility Association (FA)¹, and may not be appropriate for an individual insurance company whose portfolio of risks, rates, expenses, and operating characteristics may differ from the insurance industry averages that underlie our findings.

¹ We find the inclusion or exclusion of the FA data does not materially affect our calculated loss trend rates; but the inclusion of FA experience does increase the Industry average loss cost per vehicle.

2. Summary of Findings

In this report we present:

- assumptions, factors, and provisions we recommend² serve as Benchmarks for rate filings submitted between October 1, 2019 and March 31, 2020, and
- other assumptions, factors, and provisions for the Board's consideration as it reviews rate filings submitted between October 1, 2019 and March 31, 2020.

We note that our recommended assumptions, factors, and provisions presented in this report are preliminary. It is our understanding that this preliminary report will be posted on the Board's website, and we will consider comments received from interested parties on our preliminary report.

2.1. Analysis of Industry Claim Cost and Expense Experience

The analysis that we present in this report is of Industry claim cost and expense experience in Alberta over recent past years, including, for our analysis of trends:

- the claim experience that emerged under the reform measures that became effective in 2004;
- the claim experience that emerged includes distinct experience periods marked by:
 - the February 8, 2008 ruling by the Alberta Court of Queen's Bench striking down the Minor Injury Regulation;
 - the June 2009 Alberta Court of Appeal's decision to overturn the Court of Queen's Bench ruling;
 - the December 2009 Supreme Court of Canada's denial of the Plaintiff's request for leave to appeal; and
 - the claim experience that subsequently emerged.

We considered the Industry claim experience through December 31, 2018 as reported to GISA.

2.2. Other Comments

In this report we present our findings as respects assumptions, factors, and provisions for the Board's consideration in its review of individual rate filings. The projection of future rate needs is subject to considerable uncertainty. For this reason, we provide rationale for the assumptions, factors, and provisions we present, as well as information to help the Board evaluate their reasonableness.

We suggest that the Board also consider the reasonableness of additional information provided by interested parties that may be more current or that may provide more insight into the Industry commercial vehicle claim experience (particularly as respects the bodily injury coverage) that has emerged or is expected to emerge. However, in so doing we suggest the Board also

² We refer to these as "selections" in this report.

consider that the experience of one insurer may not be representative of the experience of the Industry.

We also suggest the Board recognize that while it may be that, alone, an alternate assumption, factor, or provision may be reasonable, it may not be reasonable to combine alternate assumptions, factors, or provisions.

The Preliminary Report of Industry Experience is an opportunity for parties to consider the findings presented herein and then express views for consideration by the Board.

3. Legislative Reforms and Government Actions

3.1. History of Rate Regulation

The Automobile Insurance Rate Board (AIRB or the Board) was established on October 5, 2004 to regulate automobile insurance premiums for Basic Coverage and to monitor premiums for Additional Coverage for commercial vehicles in the Province of Alberta.

On November 27, 2013, the *Enhancing Consumer Protection in Auto Insurance Act* was passed. The associated changes to the Insurance Act and a new, supporting, Automobile Insurance Premiums Regulation came into force effective July 1, 2014. With the changes in the Act and Automobile Insurance Premiums Regulation, the Board's mandate was expanded to also regulate Additional Coverage.

The Automobile Insurance Premiums Regulation requires the Board to conduct an Annual Review (AR) for commercial vehicles. A component of these Reviews is to analyze Industry experience and develop Benchmarks for individual rate filings. The Board considers all input in developing its Benchmarks. The Benchmarks are posted on the Board's website at <https://airb.alberta.ca> and include information that insurers should consider in preparing their rate filings.

3.2. Minor Injury Reforms

In 2003 the Alberta Government enacted Bill 53, which provided for:

- a cap on pain and suffering for minor injuries at \$4,000³;
- the consideration of collateral sources;
- the determination of wage loss based on net, rather than gross wages;
- the increase of medical/rehabilitation benefits under Accident Benefits to \$50,000; and
- maximum diagnosis and treatment protocol fees for medical/rehabilitation benefits under Accident Benefits.

These reforms became effective October 1, 2004, with the exception of the consideration of collateral sources and the determination of wage loss based on net rather than gross wages, which became effective January 26, 2004.

On February 8, 2008 the Alberta Court of Queen's Bench ruled that the Minor Injury Regulation be struck down. In June 2009 the Alberta Court of Appeal overturned the February 2008

³ The \$4,000 limit was increased to \$4,144 effective January 1, 2007; to \$4,339 effective January 1, 2008; to \$4,504 effective January 1, 2009; to \$4,518 effective January 1, 2010; to \$4,559 effective January 1, 2011; to \$4,641 effective January 1, 2012; to \$4,725 effective January 1, 2013; to \$4,777 effective January 1, 2014; to \$4,892 effective January 1, 2015; to \$4,956 effective January 1, 2016; to \$5,020 effective January 1, 2017; to \$5,080 effective January 1, 2018 and to \$5,202 effective January 1, 2019.

decision of the Alberta Court of Queen's Bench. In December 2009 the Supreme Court of Canada denied the request for leave to appeal, thereby affirming the cap on minor injuries.

On March 17, 2011 the Government extended the Minor Injury Regulation to September 30, 2016, and it was further extended to September 30, 2018.

Maximum fees for certain diagnosis and treatment protocols have been updated since introduced, with the most recent increases effective in June 2013.

A renewed Diagnostic and Treatment Protocols Regulation came into force on July 1, 2014.⁴

On May 17, 2018 the Government removed the expiry date for the Minor Injury Regulation and Automobile Accident Insurance Benefits Regulation. In addition, the Government amended the Minor Injury Regulations so as to make it clear that some temporomandibular joint injuries, as well as physical or psychological conditions or symptoms arising from sprains, strains and whiplash injuries and that resolve with those injuries, are considered minor injuries under the Minor Injury Regulation and should be treated as such.

3.3. 2007 Automobile Insurance Benefits Revision

Effective March 1, 2007, the Government revised the Accident Benefits coverage limits as follows: (1) increased the funeral benefits from \$2,000 to \$5,000 and (2) increased the maximum weekly disability income limit from \$300 to \$400 for employed individuals and from \$100 to \$135 for other individuals.

⁴ It is our understanding that the changes were administrative in nature (clarifications).

4. Analysis – General Discussion

4.1. Introduction

In the sections that follow we present:

- an analysis and discussion of Industry loss development factors and trend rates;
- the Industry loss development factors and trend rates we recommends the Board consider in reviewing Industry’s overall performance, and to serve as Benchmarks to apply to rate filings submitted between October 1, 2019 and March 31, 2020; and
- other assumptions, factors, and provisions for the Board to consider in reviewing Industry’s overall performance, and to consider in reviewing rate filings submitted between October 1, 2019 and March 31, 2020.

4.2. Claim Cost – Data

The source for the claim data that we analyze is the 2018-2 AUTO7002 Automobile Industry Exhibit (as of December 31, 2018) provided by GISA, and it includes the experience of all drivers in the Province, including the Facility Association. We refer to this as the AIX report.

The claim data that is available through the Industry AIX report is in two categories:

- Paid Claim Amounts – claim payments made by an insurance company; includes payments that were made on claims that are now closed, as well as payments made on claims that are still open (referred to as partial payments).
- Case Reserves – the insurance company’s estimate of the amount of future claim cost payments to be made on individual claims; a case reserve is assigned to each individual open claim.

The sum of (i) the paid claim amounts made on each closed or open claim and (ii) the case reserve carried on each open claim is what is referred to as reported incurred claim amounts.

The case reserves (and hence the reported incurred claim amounts) reflect the views and opinions of the respective insurance company claim adjusters that handle the individual claims and are based on the information available to the claim adjusters as of a particular point in time. Over time, the case reserves are revised by the claim adjusters to more accurately reflect the payments that are made or that are expected to be made based on additional information that becomes available to the claim adjusters.

It is important to note two points about case reserves:

1. How insurance companies determine case reserves varies from company to company. For example, it is typical for insurance companies to instruct their claim adjusters to post a pre-set amount (e.g., \$10,000 for bodily injury claims) as the case reserve when a claim is first reported and before any investigation is performed. This is referred to as the “initial claim reserve.” In a sense, the initial claim reserve serves as a placeholder until investigation is

⁵ See previous comments on recommendations.

conducted and a more accurate estimate can be established by the claim adjusters. For those companies that follow this approach, the amount of the initial case reserve and the length of time the initial claim reserve remains posted varies by company and, for a particular company, could change over time.

2. The case reserves do not reflect the “actuarial reserve” (also referred to as the bulk reserve or the IBNR reserve) that insurance companies record in their financial statements. This actuarial reserve, which is estimated by the insurance company actuaries, is an aggregate amount that is intended to provide for (i) any overall inadequacies or redundancies in the case reserves that are established on individual claims, and (ii) claims (accidents) that occurred but have not yet been reported to the insurance company as of the time of the financial statement. How insurance companies (their actuaries) determine the “actuarial reserve,” while subject to the common standards of the Canadian Institute of Actuaries, varies from company to company.

4.3. Estimating Ultimate Claim Counts and Ultimate Claim Amounts by Accident Half-Year – General Approach

We estimate the final (ultimate) number of claims and cost⁶ of all claims that arise from events that occur in the first and second half of the year, separately, through December 31, 2018 (referred to as “accident half-years”⁷) and then use those estimates to measure and select loss trend rates.

We estimate the final/ultimate claim cost by accident half-year by developing our own estimate of the needed actuarial reserve for all insurance companies in aggregate (i.e., the Industry), and adding that amount to the reported incurred claim amounts for insurance companies as published by GISA. In doing so, we consider the Industry’s reported claim amounts (the aggregate paid claim amounts and individual claim case reserves), but we do not consider the actuarial reserves established by each insurance company as they are not reported to GISA.

We estimate the Industry actuarial reserve by applying what are referred to as “loss development factors” to the aggregated reported incurred claim amounts that are reported to GISA. The selection of loss development factors that we apply is based on an analysis that we perform to determine how accurate the individual claim case reserves established by insurance companies (in aggregate) have been historically. We refer to the historical emergence of aggregate claim values (paid and incurred) as loss development patterns.

We select loss⁸ development factors to estimate the actuarial reserve need, hence the final claim cost, for each accident half-year through December 31, 2018 (we group claims by the accident half-year that the events that give rise to the claims occur), separately for each of the coverages. We follow a similar approach (using what are referred to as claim count

⁶ By “final” or “ultimate” cost we mean the amount paid by insurance companies at the time that all claims that occur in a particular year have been reported and settled.

⁷ Accident half-year refers to either the period January 1 through June 30, or July 1 through December 31 of the indicated year. We use the terms “accident half-year” and “semester” (i.e., first semester or second semester; or the June semester or December semester) interchangeably in this report. We also refer to accident half-years or semesters as XXXX-1 or XXXX-2, or XXXX.1 or XXXX.2 where “XXXX” refers to the indicated year.

⁸ We use the terms “loss,” “claim amount,” and “claim cost” interchangeably in this report. In this report, all these terms include a provision for allocated loss adjustment expenses (ALAE).

development factors) to estimate the final number of claims that will arise from events that have occurred by accident half-year through December 31, 2018, separately for each of the coverages.

Our selection of loss development factors and claim count development factors for each of the Basic coverages and Additional coverages is discussed in the next section.

5. Selection of Claim Count and Claim Amount Development Factors

The data we use to select loss development factors and claim count development factors is the Alberta AUTO7002 Automobile Industry Exhibit, 2018-2, accident half-year reported incurred loss and allocated loss adjustment expense (ALAE) and claim count data^{9 10}.

Generally, we select the weighted average of the last six development factors, adjusted, where appropriate, to reflect seasonality evident in the 6 to 12 month development period¹¹, as we consider this selection to be a reasonable balance between responsiveness and stability.¹² We refer to these selections as our default selections. For coverages with smaller data volumes, we select longer time periods as our default: for Specified Perils we use a twenty-point weighted average, and for Underinsured Motorist we use an all-semester weighted average.

Some minor exceptions to our default selections are for smoothing or recognition of a changing pattern over the more recent time periods. Our selected cumulative factors and basis for selection (e.g., weighted average of the last six development factors) are presented in Appendix A. A summary of our selected factors, estimated ultimate losses and claim counts, as well as a comparison to the selections made in our prior review are presented in Appendices C and D.

At the end of this section we present a comparison of our current and prior estimates of the ultimate loss cost, frequency and severity for each of the last five years for each coverage. We find the emerged losses during 2018 to be generally higher than our expectations based on our prior selected loss development factors.

5.1. Selection of Ultimate Loss Costs, Frequencies, and Severities

We note that the selection of development factors has an effect on the selected loss trend rates and other key assumptions, factors, and provisions.¹³ As a result of the claim experience that has emerged and the development factors we select, our estimates of ultimate loss costs,

⁹ Our selections are based on the Incurred Development Method.

¹⁰ In this Alberta Exhibit AUTO 7002, GISA advises caution in the use of the data due to reporting problems and errors by individual insurers.

¹¹ The 6-12 month development period refers to the six months following the end of the particular accident half-year. For example, the 6-12 month development period for the 2016-2 accident half-year is the period spanning January 1, 2017 through June 30, 2017. Other development periods referenced in this report (e.g., 12-18) are similarly defined.

¹² If seasonality is evident, our default selection is the weighted average of the December 2014, December 2015, December 2016, and December 2017 semester 6-12 month development factors.

¹³ A summary of our selected ultimate loss costs, severity amounts and frequency by accident half-year are presented in Appendix B.

frequencies,¹⁴ and severities by accident year have changed from those we presented for the prior review. The changes are as follows:

Changes in Estimated Loss Costs, Frequency and Severity: Bodily Injury

AY	2018 AR (as of December 31, 2017)			2019 AR (as of December 31, 2018)		
	Loss Cost	Severity	Frequency	Loss Cost	Severity	Frequency
2014	\$229.84	\$61,102	3.76	\$238.78	\$64,720	3.69
2015	\$227.16	\$71,079	3.20	\$254.68	\$80,334	3.17
2016	\$233.25	\$86,731	2.69	\$253.02	\$93,304	2.71
2017	\$269.95	\$87,120	3.10	\$319.70	\$106,400	3.00
2018				\$374.22	\$121,236	3.09

Overall, for the four-year period 2014 to 2017, our estimates of ultimate loss costs have increased by 11.0%. Most of this increase is attributed to the emerged incurred loss amount being more than expected based on our prior selected development factors. More specifically, the 2015-2, 2016-2, 2017-1, and 2017-2 accident half-years have experienced calendar year emergence that is much higher than historical levels. These changes generally have the effect of increasing our measured severity trend rates, while having little impact on our measured frequency trend rates.

We also note that claim count triangles have been restated for accident-half years 2014-1 and subsequent. For this review, we give more weight to our direct analysis of loss cost trend rates, as it is unaffected by the restated claim count triangle.

Changes in Estimated Loss Costs, Frequency and Severity: Property Damage

AY	2018 AR (as of December 31, 2017)			2019 AR (as of December 31, 2018)		
	Loss Cost	Severity	Frequency	Loss Cost	Severity	Frequency
2014	\$195.82	\$9,328	20.99	\$197.56	\$9,457	20.89
2015	\$165.61	\$9,207	17.99	\$167.67	\$9,413	17.81
2016	\$134.07	\$8,887	15.09	\$134.72	\$8,990	14.98
2017	\$158.18	\$9,606	16.47	\$161.64	\$9,574	16.88
2018				\$171.35	\$9,922	17.27

¹⁴ Number of claims per 1,000 insured vehicles.

Overall, for the four-year period 2014 to 2017, our estimates of ultimate loss costs have increased by 1.2%.

Changes in Estimated Loss Costs, Frequency and Severity: Accident Benefits–Total

AY	2018 AR (as of December 31, 2017)			2019 AR (as of December 31, 2018)		
	Loss Cost	Severity	Frequency	Loss Cost	Severity	Frequency
2014	\$9.21	\$4,388	2.10	\$9.52	\$4,558	2.09
2015	\$10.79	\$5,516	1.96	\$10.36	\$5,507	1.88
2016	\$12.31	\$6,904	1.78	\$12.48	\$6,858	1.82
2017	\$10.35	\$5,137	2.01	\$11.84	\$5,476	2.16
2018				\$11.64	\$5,978	1.95

Overall, for the four-year period 2014 to 2017, our estimates of ultimate loss costs have increased by 3.6%.

Changes in Estimated Loss Costs, Frequency and Severity: Collision

AY	2018 AR (as of December 31, 2017)			2019 AR (as of December 31, 2018)		
	Loss Cost	Severity	Frequency	Loss Cost	Severity	Frequency
2014	\$268.43	\$10,414	25.78	\$268.92	\$11,021	24.40
2015	\$238.74	\$10,833	22.04	\$238.47	\$11,334	21.04
2016	\$216.63	\$10,600	20.44	\$219.25	\$11,074	19.80
2017	\$252.04	\$10,945	23.03	\$253.82	\$11,108	22.85
2018				\$253.68	\$10,923	23.22

Overall, for the four-year period 2014 to 2017, our estimates of ultimate loss costs have increased by 0.5%.

Changes in Estimated Loss Costs, Frequency and Severity: Comprehensive

AY	2018 AR (as of December 31, 2017)			2019 AR (as of December 31, 2018)		
	Loss Cost	Severity	Frequency	Loss Cost	Severity	Frequency
2014	\$230.49	\$8,819	26.13	\$230.39	\$8,956	25.72
2015	\$230.81	\$9,570	24.12	\$230.76	\$9,664	23.88
2016	\$249.78	\$9,345	26.73	\$249.71	\$9,340	26.73
2017	\$271.50	\$9,949	27.29	\$267.88	\$9,819	27.28
2018				\$234.21	\$10,395	22.53

Overall, for the four-year period 2014 to 2017, our estimates of ultimate loss costs have decreased by 0.4%.

6. Selection of Loss Trend Rates

6.1. Introduction

Loss trend rates are factors that are used in the determination of rate level indications. They are applied to the experience period ultimate incurred losses to adjust those losses to the cost levels that are anticipated during the policy period covered under the proposed rate program.

The application of trend rates is, essentially, a two-step process. The data in the experience period under consideration is adjusted to reflect observed changes in cost conditions that have taken place (i.e., “past trend”), and then the data is further adjusted to reflect future changes in cost conditions that are expected to occur between the end of the experience period and the period the new premiums will be in effect (i.e., “future trend”).

Therefore, past trend rates should reflect the cost level changes that occurred during the experience period. Future trend rates should consider those changes as well as the likelihood that those patterns may change.

To derive estimates of appropriate loss trend rates, we consider the observed severity, frequency, and loss cost trend patterns based on our estimates of the Industry Alberta ultimate claim frequency, claim severity and loss cost¹⁵ by accident half-year that we derive (as we discuss in Section 5) and the results of regression analyses we perform. In doing so, we reflect parameters that could have an impact on the trends, such as time, seasonality, and, as appropriate, “level changes” and coverage reforms.

We also consider the results of statistical tests that we apply.

- With respect to the Adjusted R-squared statistics, we generally refer to values of 80% and greater as “high,” values between 40% and 80% as “moderate,” and values below 40% as “low.”
- We consider p -values under 5% to be “significant.”
- The confidence intervals presented correspond to a 95% probability level range.

The identification of the underlying trend patterns over the experience period is challenging because factors such as statistical fluctuation in the data points, changes in the underlying exposure, or abnormal weather conditions can make the underlying trend patterns difficult to discern. For this reason, we model the data several different ways in an attempt to identify the underlying trends during the experience period:

- with and without certain data points to improve our understanding of the sensitivity of the calculated loss trend rates to the inclusion or exclusion of those points; and
- over time periods that are longer than the experience period as a means of increasing the stability/reliability of the data being analyzed and to assess changes in trend patterns that may have occurred.

¹⁵ Our severity and loss cost estimates include allocated loss adjustment expenses and a provision for the unallocated loss adjustment expenses based on factors provided by GISA.

In selecting future trend rates, if appropriate, we adjust our selected past trend rates considering the changes that have occurred over the recent past if there is evidence of new patterns emerging.

Time Period

In this review, we present and consider the claim experience by accident half-year, spanning the twenty-year period from 1999-1 to 2018-2.

While we provide this older experience data for information purposes, we continue to select trend rates generally considering the claim experience since 2005 (following the Bill 53 reforms introduced in 2004).

Seasonality

Some coverages exhibit what is referred to as “seasonality” – where claim costs (number of claims or claim amounts) incurred during the first half of a year are generally higher/lower than claim costs incurred during the second half of a year. In the coverage-by-coverage discussion that follows, we state whether seasonality is statistically significant based on the measured p -values and, if appropriate, include seasonality in our regression model used as the basis for our trend selection.

Other Variables

We have considered the possible impact of economic conditions (as measured by the unemployment rate) and weather (such as recorded snowfall levels) on claim frequency in our prior studies. However, for a variety of reasons, which include the difficulty of forecasting the future level of the parameter, we do not explicitly consider unemployment or weather in our trend analysis.

Reforms and Level Changes

The purpose of the reform or level change parameter is to isolate and remove the impact that reforms or other events had on the level of claim costs so that the underlying claim cost trend can be identified.

As we consider the bodily injury claim experience that emerged following the Bill 53 reforms, we do not include a reform parameter in our bodily injury regression models.

As we consider the accident benefits claim experience that emerged following the 2007 reforms, we do not include a reform parameter in our regression models.

As discussed more fully below, we consider level change factors for certain coverages.

Other Considerations

In selecting loss trend rates, we also consider:

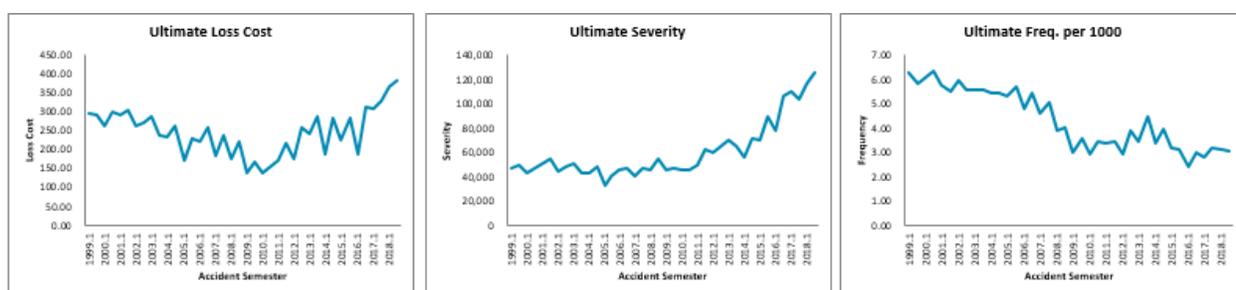

- variance in results (i.e., changes in trends) based on different historical time periods;
- relationship of frequency and severity trend patterns; and
- uncertainty in the estimated values.

6.2. Bodily Injury

For the prior review, we selected a past and future lost cost trend rate of +5.5%.

We estimate that during 2018-2, compared to the prior corresponding accident half year (2017-2), the frequency rate, the average severity, and the loss cost changed by approximately -4.7%, +22.0%, and +16.3%, respectively. We estimate that the loss cost for the accident year ending December 31, 2018 increased by 17.1% over the loss cost for the accident year ending December 31, 2017.

The following graphs display our estimate of the estimated loss cost (average claim cost per vehicle), average severity (average claim cost per claim), and frequency rate (average claim incidence rate) over the period 1999-1 through 2018-2.

The historical data points (as depicted in the above graphs) indicate a considerable amount of variability. Subject to this variability:

- following a period of decline, loss cost began to rise after 2008, and with a large decrease for 2016 followed by large increases in 2017 and 2018;
- severity has generally exhibited an upward trend after 2006; and,
- frequency exhibited a downward trend until about 2009-2011 when it flattened, followed by an increasing pattern, and then a decreasing pattern since 2013.

The modeled severity, frequency, and loss cost trends, associated Adjusted R-squared values, p -values, and confidence intervals are presented in Appendix E. These values are presented over various time periods, with and without a seasonality parameter, with no level changes,¹⁶ and with 2016-1(frequency) and 2016-2 (severity) as data exclusions. We show modeled trends ending 2018-1 and 2018-2 given the uncertainty surrounding the estimated Bodily Injury claim costs.

The modeled severity trends, without seasonality (which we do not find to be significant), over the periods beginning 2005 through 2011 and ending either 2018-1 or 2018-2 generally fall within the range of +8.5% to +12.0%¹⁷ with moderate-high Adjusted R-squared values and significant p -values for time. We select a severity trend of +11.0% based on the modeled trends

¹⁶ As discussed earlier, our selected trends are based on time periods after Bill 53 was introduced.

¹⁷ The higher trends are over the more recent periods where the impact of the relatively high severities in 2017 and 2018 is greatest.

over the periods beginning 2008 through 2010, which have the highest Adjusted R-squared values.

The selection of a frequency trend is challenging due to the flat period over 2009 to 2011.

The modeled frequency trends with seasonality (which we find to be significant), over the periods beginning 1999 through 2004 (prior to the reforms), ending 2018-2 range from around -4.0% to -4.5%, with moderate-high Adjusted R-squared values and significant p -values for time and seasonality. The modeled frequency trends with seasonality over the periods beginning 2005 to 2007, ending 2018-2 range from about -2.0% to -4.0%, with moderate Adjusted R-squared values, and significant p -values for time and seasonality. The modeled frequency trend rates beginning 2008 and onward generally do not have significant p -values for time (with some exceptions). The challenge is this time period spans a period of declining frequency (through 2010), flat to increasing frequency (through 2014), and sharply decreasing frequency (in 2015 and 2016) which then reverses to a flat/increasing frequency in 2017 and 2018.

We select a frequency trend of -3.0% based on the modeled trends over the time periods since the reforms, beginning 2005 through to 2007 and ending 2018-2, of -3.0%.

Based on our separate trend rates of +11.0% for severity and -3.0% for frequency, we determine a loss cost trend rate of +8.0% (rounded). However, given the uncertainty, particularly for claim count reporting, and volatility of the severity and frequency data, we also discuss the modeled trend rates based on the loss cost data.

The modeled loss cost trends with seasonality (which we find to be significant), over the periods beginning 2009 through 2011 (beginning where the loss cost trend rate changed to an increasing trend rate), ending 2018-1 and 2018-2, range from +8.0% to +10.0% with generally moderate Adjusted R-squared values and significant p -values for time and seasonality. The modeled loss cost trends beginning 2012 to 2015 have lower Adjusted R-squared values and a wider range of indicated trend rates.

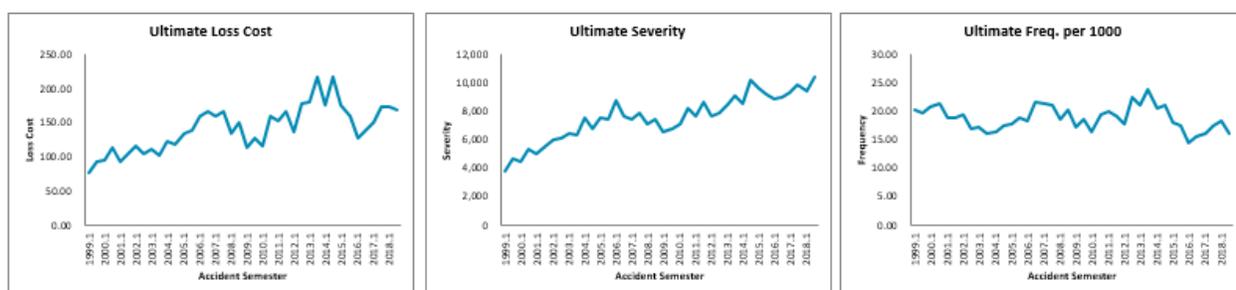

As a result, we select a past and future loss cost trend rate of +9.0% – three and a half percentage points higher than our 2018 AR selected loss cost trend.

6.3. Property Damage

For the prior review we selected a past and future loss cost trend rate of +3.0% (+3.0% for severity and 0.0% for frequency).

We estimate that during 2018-2, compared to the prior corresponding accident half year (2017-2), the frequency rate, the average severity, and the loss cost changed by approximately -8.3%, +6.0%, and -2.8%, respectively. We estimate that the loss cost for the accident year ending December 31, 2018 increased by 6.0% over the loss cost for the accident year ending December 31, 2017.

The following graphs display our estimate of the actual loss cost, average severity, and frequency rate over the period 1999-1 through 2018-2.

The historical data points indicate a considerable amount of variability – particularly for frequency. Subject to this variability:

- following a short period of decline, loss cost began to rise after 2009, but declined sharply in 2015 and 2016;
- severity has generally trended upward (excluding a decline from 2007 to 2009, and a milder decline in 2015-2 to 2016-1); and
- frequency has been variable, with repeated patterns of changing from increasing to decreasing.

The modeled severity, frequency, and loss cost trends, associated Adjusted R-squared values, p -values, and confidence intervals over various time periods ending 2018-2, with and without a seasonality parameter, and with no data exclusions, are presented in Appendix E.

The modeled severity trends, without seasonality (which we do not find to be significant), over the periods beginning 2010 (after the 2007-2009 declining period) and 2011, and ending 2018-2 generally cluster around approximately +3.0% with moderate Adjusted R-squared values and significant p -values for time. We select a severity trend of +3.0% based on these modeled trends.

The modeled frequency trends beginning prior to 2010-1 and ending 2018-2 (without seasonality which we do not find to be significant), have low Adjusted R-squared values and insignificant p -values for time and range from approximately -0.0% to -2.0%. Given the volatility of the experience, and the relatively weak statistical fits, we select a frequency trend rate of 0.0%.

Based on our separate trend rates of +3.0 for severity and 0.0% for frequency, we determine a loss cost trend rate of +3.0%. However, given the uncertainty and volatility of the severity and frequency data, we also discuss the modeled trend rates based on the loss cost data.

It is only the modeled loss cost trends without seasonality (which we do not find to be significant), over the periods beginning 1998 through to 2001 and ending 2018-2, that have moderate Adjusted R-squared values and significant p -values for time, cluster around +3.0%. (The modeled loss cost trends beginning 2002 and onward generally have low Adjusted R-squared values and insignificant p -values for time.)

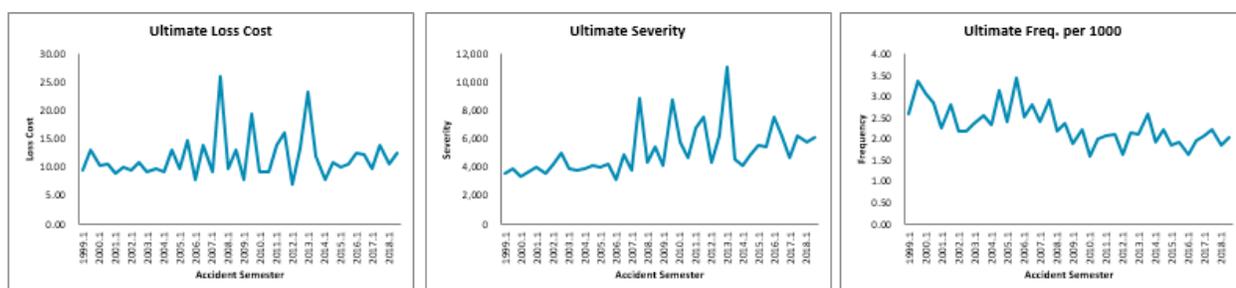

As a result, we select a past and future loss cost trend rate of +3.0% – the same as our 2018 AR selected loss cost trend rate.

6.4. Accident Benefits

For the prior review we selected a past and future lost cost trend rate of 0.0%

We estimate that during 2018-2, compared to the prior corresponding accident half year (2017-2), the frequency rate, the average severity, and the loss cost changed by approximately -9.1%, -1.1%, and -10.1%, respectively. We estimate that the loss cost for the accident year ending December 31, 2018 decreased by 1.7% over the loss cost for the accident year ending December 31, 2017.

The following graphs display our estimate of the actual loss cost, average severity, and frequency rate over the period 1999-1 through 2018-2.

The historical data points reveal a considerable amount of variability with:

- loss cost exhibiting a somewhat flat trend; and with relatively high variability due to 2007-2, 2009-2, and 2013-1 “spike” data points;
- severity generally exhibiting an upward trend, and like loss cost, relatively high variability due to 2007-2, 2009-2, and 2013-1 spikes; and
- frequency exhibiting a downward trend from 2005, changing to a relatively flat trend from about 2009.

The modeled severity, frequency, and loss cost trends, associated Adjusted R-squared values, *p*-values, and confidence intervals over various time periods ending 2018-2, with and without a seasonality parameter, with and without 2007-2, 2009-2 and 2013-1, are presented in Appendix E.

All of the modeled severity trends beginning 2007-1 through to 2015-1 and ending 2018-2, with or without the spike points of 2007-2, 2009-2 and 2013-1, without seasonality (which we do not find to be significant), have low Adjusted R-squared values and *p*-values for time that are not significant. This occurs due to the volatility in the data over these time periods. However, a visual inspection of the graphs demonstrates a positive trend in recent periods. The longer term trends, beginning 1998-1 through to 2003-2 and ending 2018-2, with or without the spike points (2007-2, 2009-2 and 2013-1), without seasonality, cluster around +3.0% and have low-moderate Adjusted R-squared values and significant *p*-values.

The modeled frequency trends over the time periods beginning 2007-2 through to 2015-1 and ending 2018-2, with seasonality which we find to be significant, do not have significant *p*-values for time. The modeled longer term trends beginning 1998-1 through to 2007-1, with seasonality, cluster around -2.0%, with moderate Adjusted R-squared values and significant *p*-values for time.

Given the uncertainty and volatility of the severity, we also discuss the modeled trend rates based on the loss cost data. All of the modeled loss cost trends beginning 1998-1 through to 2008-2 and ending 2018-2, with seasonality (which we generally find to be significant), excluding the spike points (2007-2, 2009-2 and 2013-1) range around +0.5% to +1.0%, and have low-moderate Adjusted R-squared values, but *p*-values for time that are not significant. The trends beginning 2009-1 through to 2015-1 and ending 2018-2 have very low Adjusted R-squared values and *p*-values for time and seasonality that are not significant.

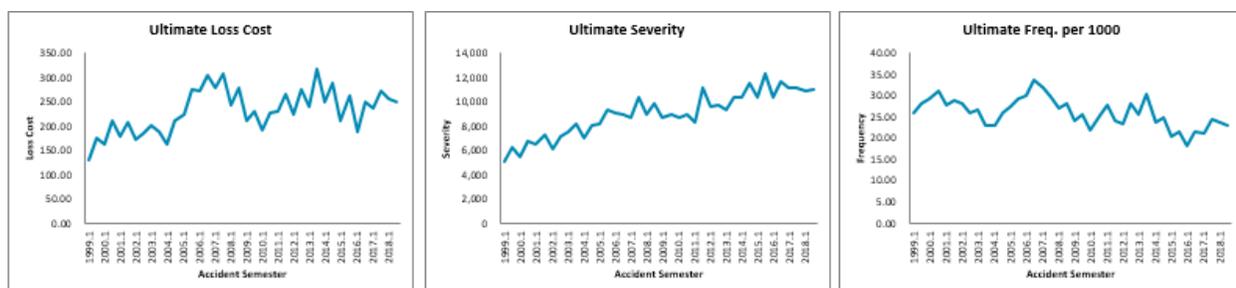

Given these results, we select a past and future loss cost trend rate of +0.0%, the same as our prior selected loss cost trend rate.

6.5. Collision

For the prior review we selected a past and future loss cost trend rate of +2.5% (+2.5% for severity and 0.0% for frequency).

We estimate that during 2018-2, compared to the prior corresponding accident half year (2017-2), the frequency rate, the average severity, and the loss cost changed by approximately -6.2%, -1.1%, and -7.3%, respectively. We estimate that the loss cost for the accident year ending December 31, 2018 decreased by 0.1% over the loss cost for the accident year ending December 31, 2017.

The following graphs display our estimate of the actual loss cost, average severity, and frequency rate over the period 1999-1 through 2018-2.

The historical data points indicate a considerable amount of variability:

- loss cost has exhibited an upward trend through 2007, followed by a downward trend through 2010, an upward trend through 2014, and further volatility in 2015 - 2018;
- severity has exhibited a generally upward trend, including a flat period over 2008 to 2010, then a continuation of the upward trend thereafter; and,
- frequency has exhibited changing trend patterns, but a downward trend since 2006 that has been relatively flat from 2009 through 2014, with declines in 2015 and 2016, and increases in 2017.

The modeled severity, frequency, and loss cost trends, associated Adjusted R-squared values, *p*-values, and confidence intervals over various time periods ending 2018-2, with and without a seasonality parameter, are presented in Appendix E.

The modeled severity trends, including seasonality, beginning 2005 through 2010 ending 2018-2 generally fall within the range of +2.0% to +3.0%, with moderate Adjusted R-squared

values and significant *p*-values for time and seasonality. The higher modeled trend rates generally begin around 2009-2010. We select a severity trend of +2.5% based on the modeled trends over these periods.

The modeled frequency trends over the periods beginning 1999-1 through to 2008-2 and ending 2018-2, without seasonality (which we do not find to be significant), have significant *p*-values for time, and generally fall within the range of approximately -1.0% to -3.0%, but with low-moderate Adjusted R-squared values. The shorter more recent time periods, (frequency trend rates beginning 2009-1 through 2015-1 and ending 2018-2), have a wider range of measured trend rates (-3.5% to 0.0%), with wider confidence intervals and generally insignificant *p*-values for time. Despite the consistent negative trend rates over most time periods, we note the statistical fits are generally poor, and we consider the large upturn in frequency in 2017 to be a possible anomaly. We select a frequency trend rate of -1.0%, one percentage point lower than our prior selection.

Given the uncertainty and volatility of the frequency data, we also discuss the modeled trend rates based on the loss cost data. Only the modeled loss cost trends beginning 1999-1 through to 2002-2 and ending 2018-2, with seasonality (which we generally find to be significant), have significant *p*-values for time and low-moderate Adjusted R-squared values. These loss cost trends range from approximately +1.0% to +2.0%. We note all other measured trend rates have insignificant *p*-values for time.

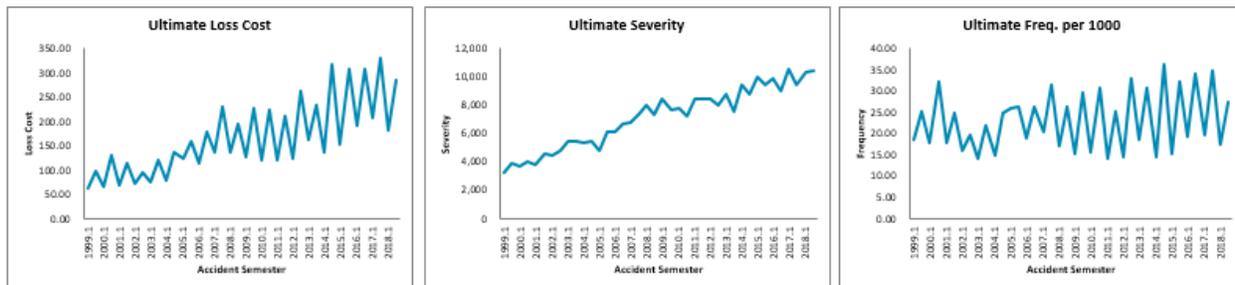

As a result, we select a past and future loss cost trend rate of +1.5% based on our separate severity and frequency selections – one percentage point lower than our 2018 AR selected trend.

6.6. Comprehensive

For the prior review we selected a past and future loss cost trend rate of +7.0%.

We estimate that during 2018-2, compared to the prior corresponding accident half year (2017-2), the frequency rate, the average severity, and the loss cost changed by approximately -21.5%, +10.9%, and -12.9%, respectively. We estimate that the loss cost for the accident year ending December 31, 2018 decreased by 12.6% over the loss cost for the accident year ending December 31, 2017.

The following graphs display our estimate of the actual loss cost, average severity, and frequency rate over the period 1999-1 through 2018-2.

As can be seen from the graphs, the comprehensive coverage claim experience has been quite volatile (particularly for frequency and, therefore, loss cost). This is largely due to the exposure

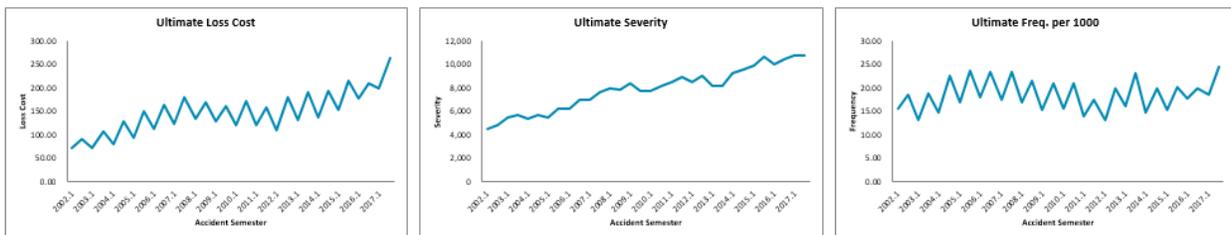

to catastrophes and, for the 2016-1 data point, the Fort McMurray wildfires (which are not considered catastrophe losses by GISA).

As GISA’s 2018 Catastrophe Report was not available at the time of this review, we present the same Excluding Catastrophe graphs that we had presented in our 2018 AR report based on the GISA Catastrophe data through to December 2017.

The following graphs that display our estimate of the actual loss cost (average claim cost per vehicle), average severity (average claim cost per claim), and frequency rate (average claim incidence rate) over the period 2002 through 2017, excluding claims attributed to catastrophes (as defined by GISA). Three sets of graphs are presented: Total Comprehensive excluding Catastrophes, Comprehensive Excluding both Catastrophes and Theft Claims, and Theft-only claims.

Comprehensive – Total (Excluding Catastrophes) – As of December 31, 2017

The following graphs display our estimate of the actual loss cost, average severity, and frequency rate over the period 2002 through 2017, excluding claims attributed to catastrophes (as defined by GISA).

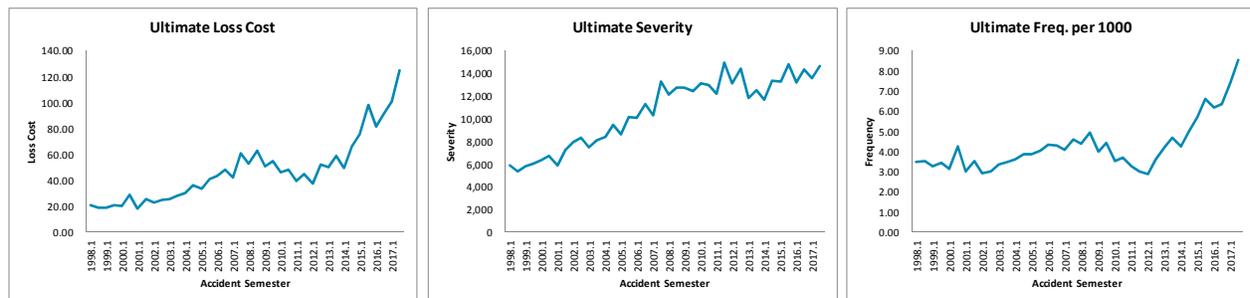

As can be seen from the graphs, the removal of catastrophe related claims reduces the variability for frequency and loss costs.

Comprehensive – Theft Only

We estimate that during 2017 theft claim frequency increased by 27.4%, severity increased by 2.3%, and loss cost increased by 30.7%.

The following graphs display our estimate of the actual loss cost, average severity, and frequency rate over the period 1998-1 through 2017-2 for Comprehensive-Theft Only.

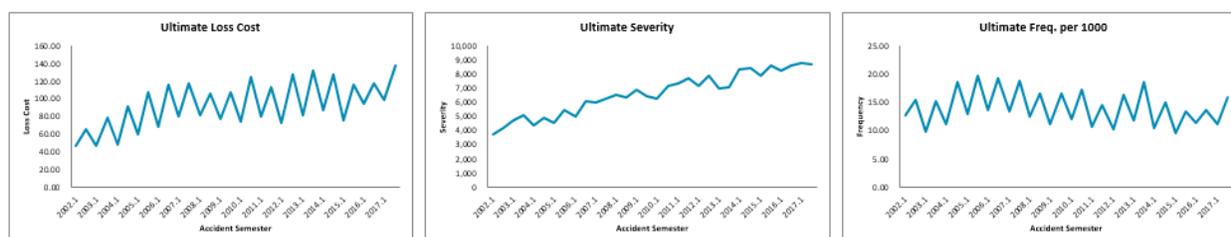

The historical data points show:

- a generally increasing loss cost trend pattern through 2008, then declining through 2011, and steeply increasing since 2014;
- a relatively steep increasing severity trend through to 2008, then a less steep trend since; and,
- a generally declining frequency trend from 2008 through 2012, then a sharply increasing trend thereafter.

The increase in theft claims since 2014 contributes to the higher Comprehensive loss costs.

Comprehensive – Excluding Catastrophe and Theft Claims

The following graphs display our estimate of the actual loss cost, average severity, and frequency rate over the period 2002 through 2017, excluding claims attributed to catastrophes (as defined by GISA) and theft claims.

As can be seen from the graphs, the removal of both catastrophes and theft claims does not dramatically change the variability in the experience, but loss cost and frequency exhibit less steep increases. Given this, we measure loss cost, severity, and frequency trends, associated Adjusted R-squared values, p-values, and confidence intervals over various trend measurement periods, with and without seasonality, (a) including and excluding claims attributed to catastrophes and (b) excluding claims attributed to both catastrophes and theft. In Appendix E we present these results.

Severity:

- The measured severity trends, without any exclusion for catastrophes or theft, over the periods 2005-2 through to 2013-2 and ending 2017-2 generally fall within the range of approximately +3.0% to +5.0% with high Adjusted R-squared values and significant p-values for time and seasonality. (Prior to 2005-2, seasonality is not significant.) The higher trends are over the more recent (shorter) time periods.
- Excluding claims attributed to catastrophes, the measured severity trends, without seasonality (which we do not find to be significant), over the periods beginning 2002-1 through to 2012-2 and ending 2017-2, generally fall within the range of +3.0% to +5.0% with moderate to high Adjusted R-squared values and significant p-values for time.
- Excluding claims attributed to theft and catastrophes, the measured severity trends, without seasonality (which we do not find to be significant), over the periods beginning 2007-1 through to 2012-2 and ending 2017-2, generally fall within the range of +3.0% to +4.0% with moderate Adjusted R-squared values and significant p-values for time.

Frequency:

- *The measured frequency trends, without any exclusion for catastrophes or theft, with seasonality (which we find to be significant), over the periods 2007-2 through 2011-2 and ending 2017-2, generally fall within the range of approximately +2.0% to +4.5% with high Adjusted R-squared values and significant p-values for time and seasonality. (The trends over the other time periods have either insignificant p-values or moderate Adjusted R-squared values.)*
- *Excluding claims attributed to catastrophes, the measured frequency trends, with seasonality, over the periods beginning 2002-1 through to 2012-2 and ending 2017-2, generally have insignificant p-values for time.*
- *Excluding claims attributed to theft and catastrophes, the measured frequency trends, with seasonality, over the periods beginning 2002-1 through 2014-2 and ending 2017-2, generally have insignificant p-values for time.*

With the exclusion of catastrophes and theft claims, the frequency trend appears relatively flat, but due to the weaker statistics and given the volatility with frequency, we considered the loss cost trend rates.

Loss Cost:

- *The measured loss cost trends, without any exclusion for catastrophes or theft, with seasonality (which we find to be significant), over the periods 1998-1 through to 2012-2 and ending 2017-2, generally fall within the range of approximately +5.0% to +8.0% with high Adjusted R-squared values and significant p-values for time and seasonality. (The trends over the shorter more recent periods are higher, but with wider confidence intervals.)*
- *Excluding claims attributed to catastrophes, the measured loss cost trends, with seasonality, over the periods beginning 2002-1 through to 2013-2 and ending 2017-2, generally fall within the range of +3.0% to +9.0% with high Adjusted R-squared values, and significant p-values for time and seasonality.*
- *Excluding claims attributed to theft and catastrophes, the measured loss cost trends, with seasonality, over the periods beginning 2005-1 through to 2014-2 and ending 2017-2, generally have insignificant p-values for time.*

Given the relative consistency of the measured loss cost trends, excluding catastrophes, over the periods beginning 2010-1 through to 2013-2 and ending 2017-2 at +7.0% to +9.0%, with high Adjusted R-squared values and significant p-values for time and seasonality, we select a past and future loss cost trend rate of +7.0%, the same as our prior review.

6.7. All Perils

Due to insufficient data, we will select a past and future loss cost trend rate that is in line with our selected rates for Collision and Comprehensive.

6.8. Specified Perils

Due to insufficient data, we will select the same past and future loss cost trend rate we select for Comprehensive.

6.9. Underinsured Motorists

Due to insufficient data, we select the same past loss cost trend rate we select for bodily injury severity, +11.0%. We are unable able to discern a frequency trend rate for this coverage and assume it is flat.

6.10. Summary of Selections

The following table summarizes our selected loss trend rates by sub-coverage compared to the loss trend rates we selected in those that we selected in our prior review.

Table 1: Estimated Annual Past/Future Loss Cost Trend Rates

Coverages	2018 AR As of December 31, 2017	2019 AR As of December 31, 2018
TPL-Bodily Injury	+5.5%	+9.0%
TPL-Property Damage	+3.0%	+3.0%
TPL - Subtotal	+4.4%	+6.6%
AB – Total	+0.0%	+0.0%
Collision	+2.5%	+1.5%
Comprehensive	+7.0%	+7.0%
All Perils	+4.0%	+3.2%
Specified Perils	+7.0%	+7.0%
Underinsured Motorist	+8.5%	+11.0%

7. Loss Adjustment Expenses

In determining their rate level needs, insurers should include provisions in their claim costs for allocated loss adjustment expenses (such as the legal expenses associated with claim settlement) and for unallocated loss adjustment expenses (the claim and settlement related expense that cannot be associated directly with individual claims) that are based on their experience.

For the analysis we perform of loss development factors, allocated loss adjustment expenses are included with the reported Industry loss data. For the analysis we perform of trends, we provide for unallocated loss adjustment expenses (ULAE) through the application of calendar year factors that are published by GISA¹⁸ to be applied to the accident year loss experience. These factors are applied uniformly to the claim and ALAE amounts of each coverage.

As points of reference for the Board as it reviews individual insurer rate filings, we provide the Board with the Industry average ULAE¹⁹ expense provisions published by GISA that are applied to the loss and allocated loss adjustment estimates.

Table 2: Unallocated Loss Adjustment Expenses

Year	ULAE %	Year	ULAE %
2003	9.3%	2011	9.5%
2004	10.3%	2012	9.1%
2005	9.7%	2013	9.9%
2006	8.7%	2014	9.3%
2007	8.9%	2015	10.3%
2008	8.4%	2016	8.5%
2009	10.5%	2017	9.2%
2010	10.2%	2018	10.1%

We include these provisions in our analysis of trends.

¹⁸ The reader is directed to GISA for full description on the data collected and how factors are determined by GISA.

¹⁹ ULAE factors prior to 2003 are presented in Appendix B.

8. Catastrophe Provision

As GISA has not updated its Catastrophe report through December 31, 2018, we repeat the discussion and recommendation we presented in our 2018 AR report.

We note that it is our understanding that the losses arising from the Fort McMurray wildfires are not considered catastrophe losses by GISA. Nevertheless, we believe that the fortuitous nature of these losses should be considered by insurers in calculating their rate level needs. Treating these losses as catastrophe related losses is one approach.

Comprehensive coverage (in particular) claim costs are affected by the occurrence (or non-occurrence) of catastrophes. GISA defines catastrophes as “weather-related events such as windstorms, hail, and flooding that caused multiple losses to the insurance industry.” Since catastrophic losses cannot be predicted, in determining rate level indications insurers should remove actual Comprehensive coverage claim costs attributed to catastrophes that occurred in the experience period, and include a provision for the amount of catastrophe losses that would be expected on average in any given year.

In the 2017 Annual Review, we had recommended (a) a Benchmark catastrophe provision of 30% (a factor of 1.30) based on the GISA catastrophe data as of December 31, 2016 and (b) that the Board consider each insurer’s distribution of business writings and catastrophe loss experience in reviewing rate level indications for the Comprehensive coverage. The 30% provision represented the approximate average of the relationship of catastrophic losses to non-catastrophic losses over the past five years.

The table below provides information on the catastrophe losses that have occurred in Alberta over the years 2002 – 2017 for commercial vehicle Comprehensive coverage as reported in GISA’s 2017 Catastrophe Report for Alberta. The table shows, among other things, the relationship (presented as factors) between the dollars of catastrophic losses to non-catastrophic losses. For example, over the last ten years approximately \$91 million of catastrophic losses have been reported as compared to approximately \$479 million of non-catastrophic losses - a ratio of 23%. Over the last five years approximately \$59 million of catastrophic losses have been reported as compared to approximately \$289 million of non-catastrophic losses - a ratio of 26%.

We acknowledge that the province has experienced a higher level of catastrophe related Comprehensive claims over the past five years as compared to the prior five years, and that this more recent experience should be given greater weight. Given the continued pattern of high proportion of catastrophe losses, we now find the five-year weighted average to be appropriate. The five-year weighted average catastrophe provision is 26%.

As we are not separately considering theft and non-theft losses in selecting the Comprehensive trend rate, we make no adjustment to the five-year weighted average to reflect an increase in theft claims.

We recommend a Benchmark catastrophe provision (rounded) of 25% (1.25).

We note that it is our understanding that the Board considers an insurer's own catastrophe loss experience in its review of rate applications. We note that it is our understanding that the losses arising from the Fort McMurray wildfires will not be considered catastrophe losses by GISA. Nevertheless, we believe that the fortuitous nature of these losses should be considered by insurers in calculating their rate level needs. Treating these losses as catastrophe related losses is one approach.

Avg. of Last 10 and 5						1.25
Recommendation						1.250

9. Investment Income on Cash Flow

The selected provision for claim cost should be adjusted (reduced) to reflect the investment income earned on the cash flows arising from the insurance operations (i.e., the premium collected before it is used to pay claim costs and other expenses). It has been the Board's position that the selected investment rate should be a risk-free rate based on Government of Alberta bond yields.

We calculate an investment rate of 2.84% in a manner consistent with the way in which the Board selected the prior investment rates; that is, based on the Alberta Government's latest forecast of risk-free investment rates.²⁰

The latest Alberta Government forecasts for short-term 3-month bills and 3-year bond yields are as follows:²¹

Year	3-Month	3-Year
2020	2.38%	2.58%
2021	2.79%	2.99%

Weighting the forecasted 3-month (25%) and 3-year (75%)²² yields results in average yields of approximately 2.53% for 2020 and 2.94% for 2021. Weighting these estimated 2020 and 2021 yields by 25%/75%²³, respectively, results in an average yield of 2.84% (rounded).

We recommend the Board consider the 2.84% rate as the risk-free interest rate Benchmark for all coverages.

²⁰ Forecast dated March 28, 2019.

²¹ Source: Alberta Treasury Board and Finance.

²² The 25%/75% weights are intended to approximate a duration of 2.3 years – the average number of years to settle Basic and Additional coverages claims.

²³ The 25%/75% weights target an average written date of April 1, 2021. This date is based on the following assumptions: (a) the interest rate will apply to filings submitted between April 1, 2020 and September 30, 2020, (b) the average filing submitted during this time period is July 1, 2020, (c) the average lag between filing submission and effective date is three months, and (d) the average written date is April 1, 2021.

10. Health Cost Recovery

Alberta Treasury Board and Finance announced the 2019 Health Cost Recovery assessment factor (percentage) at 6.70%. Consistent with the position the Board has taken with respect to the Health Cost Recovery assessment, we recommend 6.70% as the Benchmark.

11. Operating Expenses

In determining their rate level needs, insurers should include a provision for operating expenses that is based on their experience and expected future expense costs. To put the expense provisions of individual insurers in some perspective, we provide the Board with the Industry average expense provisions.

We recommend the same 26.6% operating expense provision that we recommend for private passenger vehicles serve as the benchmark for commercial vehicles. And like our recommendation for private passenger vehicles, we recommend this provision be updated when the GISA Automobile Insurance Financial Information Report for 2018 is available.

12. Profit

The Board's current position is to allow a profit provision of 7% of premium.

13. Distribution and Use

- **Usage and Responsibility of Client** – Oliver Wyman prepared this report for the sole use of the client named herein for the stated purpose. This report includes important considerations, assumptions, and limitations and, as a result, is intended to be read and used only as a whole. This report may not be separated into, or distributed, in parts other than by the client to whom this report was issued, as needed, in the case of distribution to such client's directors, officers, or employees. All decisions in connection with the implementation or use of advice or recommendations contained in this report are the sole responsibility of the client named herein.
- **Distribution, Circulation, and Publication** - This report is not intended for general circulation or publication, nor is it to be used, quoted or distributed to others for any purpose other than those that may be set forth herein or in the written agreement pursuant to which we issued this report without the prior written consent of Oliver Wyman. Neither all nor any part of the contents of this report, any opinions expressed herein, or the firm with which this report is connected, shall be disseminated to the public through advertising media, public relations, news media, sales media, mail, direct transmittal, or any other public means of communications, without the prior written consent of Oliver Wyman.
- **Third Party Reliance and Due Diligence** – Oliver Wyman's consent to any distribution of this report (whether herein or in the written agreement pursuant to which we issued this report) to parties other than of the client named herein does not constitute advice by Oliver Wyman to any such third parties. Any distribution to third parties shall be solely for informational purposes and not for purposes of reliance by any such parties. Oliver Wyman assumes no liability related to third party use of this report or any actions taken or decisions made as a consequence of the results, advice or recommendations set forth herein. This report should not replace the due diligence on behalf of any such third party.

14. Consideration and Limitations

- **Data Verification** – For our analysis, we relied on data and information provided by the client named herein and GISA without independent audit. Though we have reviewed the data for reasonableness and consistency, we have not audited or otherwise verified this data. Our review of data may not always reveal imperfections. We have assumed that the data provided is both accurate and complete. The results of our analysis are dependent on this assumption. If this data or information is inaccurate or incomplete, our findings and conclusions might therefore be unreliable.
- **Rounding and Accuracy** – Our models may retain more digits than those displayed. Also, the results of certain calculations may be presented in the exhibits with more or fewer digits than would be considered significant. As a result, there may be rounding differences between the results of calculations presented in the exhibits and replications of those calculations based on displayed underlying amounts. Also, calculation results may not have been adjusted to reflect the precision of the calculation.
- **Unanticipated Changes** – We developed our conclusions based on an analysis of the data of the client named herein and on the estimation of the outcome of many contingent events. We developed our estimates from the historical claim experience and covered exposure, with adjustments for anticipated changes. Our estimates make no provision for extraordinary future emergence of new types of losses not sufficiently represented in historical databases or which are not yet quantifiable. Also, we assumed that the client named herein will remain a going concern, and we have not anticipated any impacts of potential insolvency, bankruptcy, or any similar event.
- **Internal / External Changes** – The sources of uncertainty affecting our estimates are numerous and include factors internal and external to the client named herein. Internal factors include items such as changes in claim reserving or settlement practices. The most significant external influences include, but are not limited to, changes in the legal, social, or regulatory environment surrounding the claims process. Uncontrollable factors such as general economic conditions also contribute to the variability.
- **Uncertainty Inherent in Projections** – While this analysis complies with applicable Actuarial Standards of Practice and Statements of Principles, users of this analysis should recognize that our projections involve estimates of future events and are subject to economic and statistical variations from expected values. We have not anticipated any extraordinary changes to the legal, social, or economic environment that might affect the frequency or severity of claims. For these reasons, we do not guarantee that the emergence of actual losses will correspond to the projections in this analysis.

15. Definition of Key Terms

To assist the reader in understanding our report, in this section we define and explain several insurance terms.

15.1. Insurance Coverages

We begin with a general description of the insurance coverages. We note that throughout this discussion of the insurance coverages, the term “insured” is generally used to mean the owner, and family of the owner of the policy, as well as any passengers or other drivers using the car with the owner’s permission.

Third Party Liability (TPL)

There are two parts to this Basic Coverage:

Bodily Injury (BI) coverage protects the insured against liability arising from an accident that causes bodily injury to another person. Coverage amounts available in Alberta range from the legal minimum of \$200,000 per claim to well over \$2,000,000 per claim.

Property Damage (PD) coverage protects the insured against liability arising from an accident that causes damage to the property of another person.

All drivers must purchase at least the legally required minimum amount of TPL coverage available in Alberta.

Accident Benefits (AB)

This Basic Coverage provides for such items as reimbursement of lost income, medical care costs, and funeral costs; it also provides benefits to the dependents of a deceased insured.

Underinsured Motorist (UIM)

This Additional Coverage protects the insured if he or she is caused bodily injury by an at-fault driver who is insured, but who does not have sufficient insurance to cover the liability. In this case the insured collects, from his or her own insurer, the amount of the damage that is in excess of the at-fault driver’s liability coverage and up to the limit of UIM coverage purchased.

Collision

This Additional Coverage generally provides coverage (subject to a deductible) for damage to the insured’s vehicle arising out of a collision.

Comprehensive

This Additional Coverage generally provides coverage (subject to a deductible) for damage to the insured’s vehicle arising out of a peril other than collision (e.g., theft, vandalism, flood, hail, fire, etc.).

All Perils

This Additional Coverage combines the coverages for both collision and comprehensive into one coverage, subject to a common deductible level.

Specified Perils

This Additional Coverage, like collision and comprehensive, provides coverage (subject to a deductible) for specific perils to the insured's vehicle.

15.2. Other Terms

Accident Year

Accident year is the year in which an incident that gives rise to a claim occurred, regardless of when the claim is actually reported to an insurance company. For example, a claim reported on January 15, 2016 for injuries suffered in an automobile accident that occurred on December 15, 2015, is considered to be an accident year 2015 claim.

Allocated Loss Adjustment Expense (ALAE)

ALAE is the claim and settlement expense that can be associated directly with individual claims (e.g., legal expenses). (See ULAE).

Base Rate and Rate Differentials

Insurers generally determine the premium for a particular insured by multiplying a base rate by a series of rate differentials (or rate factors, or rate relativities) that reflect the particular characteristics of the insured. The terms rate differentials, rate factors and rate relativities are used interchangeably. Typically, there is one base rate for each combination of coverage and rating territory. For example, assume a base rate for the TPL coverage of \$200 in Territory #1 and a base rate for the TPL coverage of \$300 in Territory #2. Also assume the rate differential for a married male driver, age 40, is 1.25. The TPL premium for this driver would be \$250 in Territory #1 (\$200 times 1.25) and \$375 in Territory #2 (\$300 times 1.25).

Case Reserve

The Case Reserve is the provision established by insurance companies for the payment of future losses and claim related expenses associated with a particular claim.

Claim Frequency

Claim Frequency is the average number of claims that occur in a year, per insured vehicle. Claim frequency is a measure of the incidence of automobile claims. For example, if an insurance company provided insurance on 100 vehicles in year 2015 and 5 TPL claims occurred during 2015, the company's TPL claim frequency for 2015 would be 5 percent.

Claim Severity

Claim Severity is the average reported incurred loss and ALAE per claim. Claim severity is a measure of the average cost of automobile claims. For example, if the 5 claims in the previous example resulted in a total incurred loss and ALAE of \$100,000, the claim severity would be \$20,000.

Claim Count Development

Claim Count Development refers to the change in the number of reported claims for a particular accident year over time. (See Loss Development).

CLEAR

CLEAR refers to Canadian Loss Experience Automobile Rating, a system of categorizing Commercial vehicles, by make and model-year, for physical damage coverage rating purposes. CLEAR was developed by the Vehicle Information Centre of Canada (VICC), a part of the

Insurance Bureau of Canada. CLEAR considers such elements as the reparability and damageability of the make and model-year. (See MSRP).

Combined Ratio

Combined Ratio is a common measure of premium adequacy. This is the sum of the loss ratio plus the expense ratio (operating expenses divided by written premium). A combined ratio in excess of 100 percent is an indication of premium inadequacy, before consideration of profit and investment income.

Earned Premium

Earned Premium is the amount of written premium that is associated with the portion of the policy term that has expired. For example, assume an automobile policy with a 12-month term is sold on January 1 for \$1,000. The amount of earned premium would be \$500 on June 30.

Exposure Unit

Exposure unit is a measure of loss potential. In Commercial vehicle insurance, the exposure unit that is commonly used is the number of insured vehicles. For example, all else being equal, it would be expected that the cost to an insurance company to insure 50 cars would be twice the cost to insure 25 cars.

Health Cost Recovery Assessment

As per Provincial legislation, each insurer is assessed to achieve a target amount set by Government. The Minister of Finance publishes the assessment percentage applied to Third Party Liability written premiums every year. GISA calculates and provides the assessment as a percentage of earned third party liability premiums. Under the legislation, the Government has no subrogation rights against the at-fault parties who are insured by policies of TPL insurance; but instead, collects the assessment.

Loss Cost (Pure Premium)

Loss Cost is the average incurred loss and ALAE per insured vehicle. The loss cost is the product of claim frequency and claim severity. Using the above example, a claim frequency of 5 percent, multiplied by a claim severity of \$20,000, produces a TPL loss cost of \$1,000.

Loss Development

Loss Development is the amount by which reported incurred losses and ALAE for a particular accident year change over time. The two main reasons why reported incurred losses and ALAE amounts change (or develop) over time are:

- Reported incurred losses and ALAE only include case reserve estimates on claims for which the claim adjuster has knowledge, i.e., case reserves are only established on the claims that have been reported to the insurance company. Since typically some period of time elapses between the time of the incident and when it is reported as a claim, the number of reported claims for an accident year would be expected to increase over time. Claims that are reported after the close of an accident year are referred to as “late-reported” claims; and
- Reported incurred losses and ALAE also develop because, for a number of reasons, the initial case reserves established by claims adjusters, cannot fully and accurately reflect the amount the claim will ultimately settle at. We further note that, over time, the percentage by which reported incurred losses and ALAE develop for a given accident year should decline. This is because as accident years become more mature (i.e., become older), fewer reserve

estimates are adjusted to reflect newly reported late claims, actual payments, and additional information that becomes available to the claims adjuster.

Loss Ratio

Loss ratio is the common measure of premium adequacy. Loss ratio is usually defined as estimated ultimate incurred losses and ALAE, divided by earned premium. But the ultimate incurred losses and ALAE may also include provisions for ULAE and the Health Cost Recovery assessment. A loss ratio that exceeds a company's break-even loss ratio (100 percent less budgeted expenses) would suggest premium inadequacy.

Loss Reserving Methods: Incurred Loss Method and Paid Loss Method

Loss reserving methods are often based on historical data grouped into a triangle format. A common approach is to have the rows represent the accident years, and the columns representing the value of the loss at specific dates, such as 12 months, 24 months, 36 months etc., from the beginning of the accident year. The historical changes in the loss data from period to period is reviewed to estimate a pattern to predict how current accident years losses will change over time as claims are settled and closed. The Incurred Loss Method refers to the triangle method of analysis, based on reported incurred losses. The Paid Loss Method refers to the triangle method of analysis, based on paid losses.

MSRP

MSRP refers to the Manufacturer's Suggested Retail Price, and is a system of categorizing Commercial vehicles, by make and model-year, for rating purposes for physical damage coverages, according to the original price of the vehicle. (See CLEAR).

Operating Expenses

Insurance company expenses, other than ALAE and ULAE, are typically categorized as Commissions, Other Acquisition, General, Taxes, Licenses, and Fees.

Paid Losses

The total aggregate dollar amount of losses paid on all reported claims as of a certain date.

Premium Drift

Premium Drift is a more general term, and refers to the changes in the amount of premium collected by insurance companies that are attributed to the purchase of newer and more expensive cars (i.e., rate group drift) as well as to changes in the amount of insurance coverage that is purchased (e.g., the purchase of higher limits of liability coverage would increase the amount of premium collected by insurance companies, while the purchase of higher physical damage deductibles would reduce the amount of premium collected by insurance companies). (See Rate Group Drift).

Rate Group Drift

Rate Group Drift refers to the amount of additional premium collected by insurance companies that is attributed to the purchase of newer and more expensive cars by insureds. The premiums charged by insurance companies are higher for newer and more expensive cars. Therefore, as insureds purchase newer and more expensive cars, the amount of premium collected by insurance companies increases. (See Premium Drift).

Ratemaking Methods: Pure Premium Method and Loss Ratio Method

The Pure Premium Method of ratemaking develops indicated rates that are expected to provide for the expected losses and expenses, and provide for the expected profit. The Loss Ratio Method of ratemaking develops indicated rate changes rather than indicated rates.

Rating Territory

Automobile premiums vary by the principal garaging location of the vehicle. Based on Insurance Bureau of Canada's automobile statistical plan, Alberta is currently divided into three areas, or rating territories, of principal garaging location; and, therefore, has three separate sets of rates depending upon which of the three territories the vehicle is principally garaged. (See Statistical Territory)

Reported Incurred Loss

The sum of:

- the total aggregate dollar amount of losses paid on all reported claims as of a certain date (referred to as the valuation date), and
- the total aggregate dollar amount of losses set in reserve by the claim adjusters on each open claim (referred to as "case reserves") as of a certain date (the same evaluation date as for the paid claim amounts).

For example, if two claims were filed against an insurance company, one that settled for \$50,000 and the other that was open with a paid amount of \$25,000 and a "case reserve" (i.e., the claim adjuster's estimate of the dollars still to be paid on the claim) of \$30,000, then the total reported incurred loss on the two claims would be \$105,000 (the sum of \$50,000, \$25,000, and \$30,000).

Reserve

A Reserve is the aggregate provision identified by an insurance company for the payment of future losses and claim related expenses associated with claims that have been incurred.

Surplus

Surplus is the amount of assets of an insurance company in excess of its liabilities.

Statistical Territory

Automobile premiums vary by the principal garaging location of the vehicle. Alberta is divided into four statistical territories, of principal garaging location. Specific statistical territories are grouped together to represent a specific rating territory. In some cases there is one statistical territory in a rating territory, in other cases the rating territory comprises two or more statistical territories. (See Rating Territory).

Total Return on Equity

Total Return on Equity (ROE) refers to an insurer's profit as a percentage of its surplus, where profit is the sum of (i) underwriting profit, and (ii) investment income earned on both the underwriting operations of the company and on the surplus carried by the company.

Unallocated Loss Adjustment Expense (ULAE)

ULAE is the claim and settlement related expense that cannot be associated directly with individual claims (e.g., claim adjuster salaries). (See ALAE).

Underwriting Profit

Underwriting Profit is defined as earned premium, less reported incurred losses and ALAE, less ULAE, less operational expenses.

Underwriting Profit Margin

Underwriting Profit Margin is the provision that is included in the insurance premium for underwriting profit to be earned by the company.

Ultimate Incurred Loss

Ultimate Incurred Loss is an estimate of the total amount of loss dollars that will ultimately be paid to settle all claims that occur during a particular accident year.

Written Premium

Written Premium represents the total amount of premium charged by an insurance company for the insurance policies it has sold. It is generally compiled over a one-year period.

16. Closing

This report was prepared by Paula Elliott, FCAS, FCIA and Rajesh Sahasrabuddhe, FCAS, MAAA of Oliver Wyman.

We are available to answer any questions the Board may have on our report.

Sincerely,

Paula Elliott, FCIA, FCAS
paula.elliott@oliverwyman.com

Rajesh Sahasrabuddhe, FCAS, MAAA

17. Appendices A - E

Appendix A: Selected reported claim count and reported incurred claim amount development factors and basis for selection.

Appendix B: Estimate of the ultimate loss cost, severity and frequency by accident half-year; and period to period percentage changes.

Appendix C: Reported incurred claim amount, reported paid claim amount, estimated ultimate claim amount and comparison to prior review estimated ultimate claim amount by accident half-year.

Appendix D: Reported incurred claim count, estimated ultimate claim count and comparison to prior review estimated claim count by accident half-year.

Appendix E: Summary of loss trend regression analysis which includes estimated trend results for various time periods; with and without a seasonality parameter; with and without certain data points.

- Bodily Injury: Pages 1 to 17
- Property Damage: Pages 18 to 19
- Accident Benefits: Pages 20 to 23
- Collision: Pages 24 to 27
